

Appendix 1 - Editing code spelling and text formatting using AI

Direct link to Google Gemini AI conversation: <https://share.gemini.google/POBzlimY6y7s>

The screenshot shows a Gemini Pro chat window. At the top, there's a header with the Gemini logo and 'Gemini Pro'. On the right, there are icons for sharing and a menu. A file icon labeled 'FOOD_ANALYSIS' is visible. The user's question is: 'how do I safely change the names of fiber to fibre in this code file'. The AI's response explains that using 'Fibre' is better for localization but warns that a simple 'Find and Replace' of 'Fiber' to 'Fibre' would break the code because the external datasets 'nutrient.csv' and 'food_matrix_5d.csv' use the American spelling 'Fiber, total dietary'. It suggests using the '.rename()' function in pandas. The response is structured with a heading '1. Rename the Column in the DataFrame' and a sub-heading 'Before you change your target nutrient lists, you need to explicitly tell pandas to rename the column after it is created or loaded.' It then provides instructions on how to use '.rename()' in a pandas pivot table. At the bottom, there's a text input field with a plus icon and the text 'Ask Gemini', and a microphone icon. A disclaimer at the bottom states: 'Gemini is AI and can make mistakes, including about people. Your privacy & Gemini'. The Windows taskbar is visible at the very bottom, showing various application icons, system tray icons (including network, volume, and battery), and the date/time '03:29 25/08/2026'.

Gemini Pro

FOOD_ANALYSIS

how do I safely change the names of fiber to fibre in this code file

It is completely understandable to want to localize your code and use the British spelling "Fibre." However, because your code relies on an external dataset (`nutrient.csv` and `food_matrix_5d.csv`) that uses the American spelling "Fiber, total dietary", a simple "Find and Replace" across the entire file will break your code and result in a `KeyError`. `IPYNB`

Here is the safest way to change "Fiber" to "Fibre" without breaking your data analysis pipeline.

1. Rename the Column in the DataFrame

Before you change your target nutrient lists, you need to explicitly tell pandas to rename the column after it is created or loaded.

In the cell where you create the `food_matrix` pivot table, add a `.rename()` function right after filling the empty values: `IPYNB`

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

03:29 25/08/2026

1. Rename the Column in the DataFrame

Before you change your target nutrient lists, you need to explicitly tell pandas to rename the column after it is created or loaded.

In the cell where you create the `food_matrix` pivot table, add a `.rename()` function right after filling the empty values: `IPYNB`

Python

```
# Converting the table from a vertical format to horizontal format
food_matrix = df_joined.pivot_table(
    index='description',
    columns='name',
    values='amount',
    aggfunc='mean'
).fillna(0)

# SAFELY RENAME THE COLUMN HERE
food_matrix.rename(columns={'Fiber, total dietary': 'Fibre, total dietary'}, inplace=True)
```

You must also do this in the cell where you create `food_matrix_2`: `IPYNB`

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:30
25/08/2026

Python

```
food_matrix_2 = df_joined_3.pivot_table(  
    index=['description', 'food_category_id'],  
    columns='name',  
    values='amount',  
    aggfunc='mean'  
) .fillna(0).reset_index()  
  
# SAFELY RENAME THE COLUMN HERE  
food_matrix_2.rename(columns={'Fiber, total dietary': 'Fibre, total dietary'}, inplace=True)
```

2. Update Your Target Nutrient Lists

Once the DataFrames are using the new spelling, you can safely update the text strings inside your Python lists.

Update the `target_nutrients` list: IPYNB

Python

```
target_nutrients = [
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:31
25/08/2026

2. Update Your Target Nutrient Lists

Once the DataFrames are using the new spelling, you can safely update the text strings inside your Python lists.

Update the `target_nutrients` list: `IPYNB`

Python

```
target_nutrients = [  
    'Fibre, total dietary',  
    'Fatty acids, total polyunsaturated',  
    'Magnesium, Mg'  
]
```

And update the `nutrients_5d_order` lists (which appear twice in your file): `IPYNB`

Python

```
nutrients_5d_order = [  
    'description',  
    'food_category_id',  
]
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:31
25/08/2026

```
nutrients_5d_order = [  
    'description',  
    'food_category_id',  
    'Fibre, total dietary',  
    'Fatty acids, total polyunsaturated',  
    'Magnesium, Mg',  
    'Vitamin_D_Total_UG',  
    'Zinc, Zn'  
]
```

3. Update the Output Strings

You have a `print()` statement that outputs a DataFrame formatted with the old spelling. Because the column is now renamed, this will automatically print as "Fibre, total dietary" when you re-run the notebook.

Summary of Best Practices

- **Avoid global Find and Replace:** Do not open the raw `.ipynb` JSON file in a text editor to mass-replace the word. It will corrupt the executed output metadata. `IPYNB`
- **Re-run the notebook:** After making these code changes inside Jupyter Notebook or VS Code, click **Restart Kernel and Run All** to ensure the new spelling propagates through all your outputs and matrices. `IPYNB`

+ Ask Gemini

Would you like me to show you how to write a quick loop to automatically standardize all US spellings (like "color", "flavor") to UK spellings across your entire DataFrame?

EDA_ONLY

how do i set seed in this file

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:32
25/08/2026

Setting a random seed is a fantastic habit! It ensures that your data analysis and machine learning models are entirely reproducible for anyone else running your code.

Here is how you can set the seed for the libraries you are using in this specific file:

1. Global Seed for NumPy

You have already imported NumPy in your first code block using `import numpy as np`. To set a global seed for any random operations that rely on NumPy, simply add this line right below your import block: `IPYNB`

Python

```
np.random.seed(42) # You can use 42 or any integer you like!
```

2. Seed for Scikit-Learn

I see you have also imported `train_test_split` and `RandomForestRegressor`. While you aren't explicitly calling them in the provided data-cleaning steps yet, scikit-learn does not use a global seed. Instead, when you eventually call these functions, you will need to pass the `random_state` parameter directly into them like this: `IPYNB`

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:32
25/08/2026

Python

```
# Setting the seed for your data split
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)

# Setting the seed for your machine learning model
rf_model = RandomForestRegressor(random_state=42)
```

Are you planning to train your predictive model for the PCOS diagnosis in this same notebook, or will you be moving to a new file?

how do I safely set a seed in this file and change fiber to fibre

It is great that you are keeping reproducibility and localization in mind! Because your code relies heavily on the specific strings from your dataset, changing "Fiber" to "Fibre" takes a few targeted steps to avoid breaking your filtering logic and matrices.

Here is how you can safely tackle both the seed and the spelling changes in this file.

1. Safely Setting a Random Seed

Interestingly, the recommender logic you built in this file (Cosine Similarity, MinMax Scaling, and the `if/elif` logic) is entirely deterministic, meaning it doesn't actually rely on random sampling to generate outputs. IPYNB

However, setting a global seed is still a great safety net, especially if the imported evaluation metrics (`food_catalog_coverage` , `intra_list_diversity` , etc.) use random sampling under the hood. You can set the global NumPy seed right inside your first code cell after the imports: `IPYNB`

Gemini is AI and can make mistakes, including about people. Your privacy & Gemini

ENG
UK

03:32
25/08/2026

Python

```
#Importing essential libraries functions from other files
import pandas as pd
import numpy as np
np.random.seed(42) # SAFELY SET YOUR SEED HERE

from sklearn.metrics.pairwise import cosine_similarity
from sklearn.preprocessing import MinMaxScaler
import matplotlib.pyplot as plt
import seaborn as sns
from collections import Counter
```

2. Safely Changing "Fiber" to "Fibre"

Because the USDA database relies on the spelling "Fiber, total dietary", you need to rename the column after you create your pivot tables, and then update all downstream references. [IPYNB](#)

Step A: Rename the columns immediately after your Pivot Tables

In Cell 4, right after you create `food_matrix` : [IPYNB](#)

Python

```
food_matrix = df_joined.pivot_table(
    index='Description'
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:33
25/08/2026

Python

```
food_matrix = df_joined.pivot_table(  
    index='description',  
    columns='name',  
    values='amount',  
    aggfunc='mean'  
)  
.fillna(0)  
  
# ADD THIS LINE  
food_matrix.rename(columns={'Fiber, total dietary': 'Fibre, total dietary'}, inplace=True)
```

In Cell 6, right after you create `food_matrix_2`: IPYNB

Python

```
food_matrix_2 = df_joined_3.pivot_table(  
    index=['short_name', 'food_category_id'],  
    columns='name',  
    values='amount',  
    aggfunc='mean'  
)  
.fillna(0).reset_index()
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:33
25/08/2026

```
# ADD THIS LINE
food_matrix_2.rename(columns={'Fiber', 'total dietary': 'Fibre', 'total dietary'}, inplace=True)
```

Step B: Update your Target Nutrient Lists

Now that the DataFrames use the British spelling, update the strings inside your target lists so pandas knows what to look for.

- In Cell 4, update the `target_nutrients` list to use `'Fibre, total dietary'`. `IPYNB`
- In Cells 9, 11, 13, 15, and 18, update the `nutrients_5d_order` list to use `'Fibre, total dietary'`. `IPYNB`

Step C: Update your Hard Clinical Constraint Masks

In Cells 15 and 18, you apply a hard filter using a Pandas mask. You must update the string in the brackets to match the new column name: `IPYNB`

Python

```
#Elevated need for Fiber (Ensure you update the variable to Fibre if you wish, but)
if target_fiber > 25:
    #Filtering out the foods that don't contain a lot of Fiber
    fiber_mask = filtered_food_db['Fibre, total dietary'] > 0.5 # UPDATE STRING I
```

RECOMMEND
ER_LOGIC

how do I safely change fiber to fibre in this file

It makes complete sense that you want to localize your code to use the British spelling "Fibre." However, because your code relies on external USDA datasets (`nutrient.csv` and `food_nutrient.csv`), the underlying data strictly uses the American spelling "Fiber, total dietary". Changing this exact string in the initial data extraction steps will cause a `KeyError` and break your pipeline. `PY`

Here is the safest way to change the variable names and output columns to "fibre" without breaking the USDA data ingestion.

1. Keep the Initial Data Extraction Unchanged

Leave the `nutrients_5d_order` list exactly as it is. It must use the American spelling to successfully pull the data from the pivot table: `PY`

Python

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

03:34
25/08/2026

```
nutrients_5d_order = [
    'short_name',
    'food_category_id',
    'Fiber, total dietary', # DO NOT CHANGE THIS LINE
    'Fatty acids, total polyunsaturated',
    'Magnesium, Mg',
    'Vitamin_D_Total_UG',
    'Zinc, Zn'
]
```

2. Update the Dictionary in `get_recommendations`

In your `get_recommendations` function, you already rename the columns to be more developer-friendly. Update the target alias to `'fibre_g'`: PY

```
#Renaming the Raw DQL nutrient column names
food_df = food_df.rename(columns={
    "Fiber, total dietary": 'fibre_g', # UPDATED HERE
    "Fatty acids, total polyunsaturated": 'pufa_g',
```

Gemini is AI and can make mistakes, including about people. Your privacy & Gemini

```
food_df = food_df.rename(columns={
    "Fiber, total dietary": 'fibre_g', # UPDATED HERE
    "Fatty acids, total polyunsaturated": 'pufa_g',
    "Magnesium, Mg": 'magnesium_mg',
    "Vitamin D Total_UG": 'vitamin_d_mcg',
    "Zinc, Zn": 'zinc_mg'
})
```

3. Update the Variables and Filtering Logic

Further down in the `get_recommendations` function, update your target variables and your pandas DataFrame filtering mask to use the new spelling: PY

Python

```
#Nutrient order
target_fibre = patient_vector[0] # UPDATED VARIABLE NAME
target_pufa = patient_vector[1]
target_magnesium = patient_vector[2]
target_vit_d = patient_vector[3]
target_zinc = patient_vector[4]

#Elevated need for Fibre
if target_fibre > 25: # UPDATED VARIABLE NAME
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

```
#Elevated need for Fibre
if target_fibre > 25: # UPDATED VARIABLE NAME
    #Filtering out the foods that don't contain a lot of Fibre
    filtered_food_db = filtered_food_db[filtered_food_db['fibre_g'] > 0.5] # UPD
```

4. Update the Scaling List

Finally, update the `nutrient_cols` list that isolates the data for the `MinMaxScaler` : PY

Python

```
#Isolating the 5 nutrients in the vector
#For scaling
nutrient_cols = ['fibre_g', 'pufa_g', 'magnesium_mg', 'vitamin_d_mcg', 'zinc_mg']
```

By making these specific changes, you successfully update the code's internal logic and output dictionary to use "fibre" while preserving the necessary American spelling for the initial raw data extraction. PY

Would you like me to review the `nutrient_vector_2` logic to ensure all the math and conditional statements align perfectly with your clinical goals?

WORKING_AP
P

how do I safely change fiber to fibre in this file

Changing "fiber" to "fibre" in this specific file is incredibly straightforward and completely safe!

Because this file primarily handles the web application's routes and user interface strings, the word "fiber" only appears as plain text intended for the user to read. It does not interact with the USDA database columns or the JSON dictionary keys, so altering it will not break any backend logic. `PY`

Here is the single safe change you need to make inside the `Generate_nutrition_message`

Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:35
25/08/2026

Here is the single safe change you need to make inside the `generate_nutrition_message` function:

Locate this line (around line 70):

Python

```
if fibre > 25.0:  
    messages.append("Increased fiber take: this can help manage blood glucose sp:
```

Change it to:

Python

```
if fibre > 25.0:  
    messages.append("Increased fibre intake: this can help manage blood glucose :
```

(Note: I also safely corrected the typo "take" to "intake" here to make your UI message sound a bit more natural!)

UK

03:36
25/08/2026

(Note: I also safely corrected the typo "take" to "intake" here to make your UI message sound a bit more natural!)

PY

Once you save the file, your Flask application will immediately start displaying the British spelling to your users.

Is there anything else in the web application's UI or routing that you need help refining?

TESTING

do I need to change any fibers to fibre in this one

Yes, you absolutely need to make one important update in this file!

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:36
25/08/2026

Yes, you absolutely need to make one important update in this file!

Because you just updated the UI message in your `WORKING_APP.py` file to use the British spelling "fibre" and fixed the "intake" typo, **Test 11** in this unit testing file will now fail if you don't update it to match. The test is explicitly checking for the old, exact string. `PY + 1`

Here is the single safe change you need to make:

Locate this line in **Test 11** (around line 144):

Python

```
#Assserting specific strings that were correctly appended to the list  
self.assertIn("Increased fiber take: this can help manage blood glucose spike
```

Change it to match your new UI string:

Python

```
#Assserting specific strings that were correctly appended to the list  
self.assertIn("Increased fibre intake: this can help manage blood glucose spike
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:36
25/08/2026

Python

```
#Assserting specific strings that were correctly appended to the list  
self.assertIn("Increased fibre intake: this can help manage blood glucose sp:
```

I noticed that the rest of your comments and annotations in this test file (like `#Order: Fibre, PUFA...`) are already using the British spelling "Fibre". Once you update this specific `self.assertIn()` statement, all of your unit tests should pass flawlessly! PY

EVALUATION_
METRICS

do I need to change any fibers to fibre in this one

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:36
25/08/2026

Yes, you absolutely need to change "Fiber" to "Fibre" in this file!

Because this file extracts raw nutrient values directly from your DataFrame to calculate the evaluation metrics, leaving the American spelling here will result in a `KeyError` since you renamed the column in your main logic. `PY`

Here are the specific places you must update:

1. Update the `nutrients_5d_order` list in `intra_list_diversity`

Around line 53, change the first item in the list: `PY`

Python

```
#Retrieve order of nutrients
nutrients_5d_order = [
    'Fibre, total dietary', # UPDATE THIS LINE
    'Fatty acids, total polyunsaturated',
    'Magnesium, Mg',
    'Vitamin_D_Total_UG',
    'Zinc, Zn'
]
```

2. Update the `nutrients_5d_order` list in `nutrient_contribution_test`

Around line 125, make the exact same change: `PY`

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:37
25/08/2026

Python

```
def nutrient_contribution_test(patient_df, food_db, vector_function, recommender_fun):  
    #Retrieve order of nutrients  
    nutrients_5d_order = [  
        'Fibre, total dietary', # UPDATE THIS LINE  
        'Fatty acids, total polyunsaturated',  
        'Magnesium, Mg',  
        'Vitamin_D_Total_UG',  
        'Zinc, Zn'  
    ]
```

3. Update the `nutrient_fulfillment` dictionary (Optional but recommended)

Around line 133, there is a dictionary used to format the final printout. Changing this will ensure your terminal prints "Fibre" instead of "Fiber": `PY`

Python

```
#Dictionaries to track the percentages across all patients  
nutrient_fulfillment = {  
    'Fibre': [], # UPDATE THIS LINE  
    'PUFAs': [],  
    'Magnesium': [],
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:37
25/08/2026

Making these changes will keep your evaluation metrics perfectly synced with your updated DataFrame!

MODELLING_
FILE

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. Your privacy & Gemini

Standardizing your British English spellings across your project is a great idea! In "MODELLING_FILE.ipynb", the word "catalog" appears in two different contexts: as simple text in print statements/comments, and as a Python function name. IPYNB

Here is how to safely change both without breaking your code.

1. Safely Update Text and Comments

You can freely change the text inside your strings and comments without breaking any logic.

- **Print Statements:** In cells 5, 7, 10, 12, 14, 16, and 22, you have the following print statement:

IPYNB

Python

```
print("Food Recommender Catalog Coverage")
```

Change this to `print("Food Recommender Catalogue Coverage")`.

- **Comments:** In those same cells, you can safely update the comment `#Calling the food catalog coverage metric...` to use "catalogue". IPYNB

2. Updating the Function Name (Requires Care)

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:37
25/08/2026

In your first cell, you import a function named `food_catalog_coverage` from your `EVALUATION_METRICS.py` file, and then you call this function to calculate your baseline coverage throughout the notebook. [IPYNB](#)

If you want to rename this function to `food_catalogue_coverage`, you must do it in two places to avoid an `ImportError`:

1. In `EVALUATION_METRICS.py`: Rename the function definition from `def food_catalog_coverage(...)` to `def food_catalogue_coverage(...)`.
2. In `MODELLING_FILE.ipynb`: Update the import statement in Cell 1: [IPYNB](#)

Python

```
from EVALUATION_METRICS import food_catalogue_coverage, intra_list_diversity, ir
```

Then, update every instance where you call it (Cells 5, 7, 10, 12, 14, 16, and 22): [IPYNB](#)

Python

```
baseline_coverage = food_catalogue_coverage( # UPDATED HERE
    patient_df=patientdata,
    ...
)
```

+ Ask Gemini

Gemini is AI and can make mistakes, including about people. [Your privacy & Gemini](#)

ENG
UK

03:38
25/08/2026

Bonus: Fixing your `TypeError`

I noticed the traceback in Cell 24 of your notebook threw a

`TypeError: max() got an unexpected keyword argument 'max'`. This happened because of a small typo on line 33 where an equals sign slipped into the `max()` function.

IPYNB + 1

Change line 33 from this:

Python

```
ax.set_ylim(0, max(max(primary_nutrients), max=(proxy_nutrients)) + 20)
```

To this:

Python

```
ax.set_ylim(0, max(max(primary_nutrients), max(proxy_nutrients)) + 20)
```

Are there any other files in your repository where you need to track down American spellings or fix syntax errors?
